Solve the Parameters of a Circular Horizontal Curve, given any two Parameters
Programmer: Dr. Bill Hazelton
Date: April, 2008.
Version: 1.1
Mnemonic: $\mathbf{S}$ for Curve Solution.

## Notes

1. The ${ }^{* * * *}$ lines are comments and are not to be entered into the calculator. They are there to make it easier to work through entering a long program.
2. Be very careful when entering the line numbers in the various XEQ and GTO statements.
3. Angles are entered and displayed in HP notation (DDD.MMSSss).

## Solve the Parameters of a Circular Horizontal Curve

4. The program will not work for parameters that are the result of a deflection angle greater than or equal to $180^{\circ}$. This produces a "division by zero" error. Similarly, "impossible figures" will not produce correct results.
5. Some pairs of parameters have considerable sensitivity to small variations in their values. Therefore, consider doing a little sensitivity analysis (e.g., re-do the calculation with the parameters changed by an amount about equal to the expected error in them) to see what a reasonable precision of the result might be.
6. This program is designed to work with exactly two parameters. If you have more or fewer, the program will demand that you use only two. Choose the two most suitable parameters and ignore the others, using them as a check on the values produced. The program cannot do an adjustment based on redundant data.

## Theory

The theory of solving the parameters of a horizontal circular curve is fairly straightforward. Given a curve as shown in the figure below, the various parameters are related through the following equations. Therefore, given any two parameters, it is possible to solve for all the others.

In this situation, $\theta$ is the deflection angle, or angle at the center of the arc; c is the chord length; r is the radius; $a$ is the length of the arc of the curve; $t$ is the length of the tangent, from the tangent point to the intersection point; and A is the area of the segment between the arc and the chord (shown with gray shading).

The perpendicular bisector of the chord also bisects the angle at the center of the curve $(\theta)$, dividing the quadrilateral into two congruent right triangles, and the isosceles triangle formed by the radii and the chord into two other congruent right triangles. Solving these triangles in various ways allows any two parameters to solve most of the other parameters. The formulae used are as follows:

$$
\begin{aligned}
& \theta=2 \arcsin \left(\frac{c / 2}{r}\right)=2 \arccos \left(\frac{c / 2}{t}\right)=2 \arctan \left(\frac{t}{r}\right) \\
& r=\frac{c / 2}{\tan (\theta / 2)}=\frac{a}{\theta} \\
& c=2 r \sin \left(\frac{\theta}{2}\right)=2 t \cos \left(\frac{\theta}{2}\right) \\
& t=\frac{c / 2}{\cos (\theta / 2)} \\
& a=r \theta \\
& A=\frac{1}{2} r^{2}(\theta-\sin \theta)
\end{aligned}
$$

When $\theta$ is used by itself, it usually denotes its use as a radian value.
In the event that the chord and arc, or the tangent and arc, are the only values known, the solution is not direct. Instead, the following equations are set up (in the subprogram with label U), for each case:

$$
\frac{2 \sin \left(\frac{\theta}{2}\right)}{\theta}-\frac{c}{a}=0
$$

$$
\text { and } \quad \frac{\tan \left(\frac{\theta}{2}\right)}{\theta}-\frac{t}{a}=0
$$

respectively.
These are solved for $\theta$ using the HP Solve capability in the calculator, after a starting estimate for $\theta$ is calculated.

## Running the Program

Key in XEQ S then press the Enter key. The program starts and displays:
SOLVE HZ CURVE
then prompts for the chord length, displaying:

## CHORD LENGTH

then stops while displaying:
C?
0.0000

## Solve the Parameters of a Circular Horizontal Curve

If the length of the chord is known, key it in and press $\mathrm{R} / \mathrm{S}$. If it is not known, leave the value at zero and press R/S. The calculator then displays:

RADIUS
then stops while displaying:
R?
0.0000

If the radius is known, key it in, then press R/S. If it is not known, leave the value at zero and press $\mathrm{R} / \mathrm{S}$. The calculator then displays:

## DEFLECTION $\theta$

then stops while displaying:
Q?
0.0000

If the value of the deflection angle is known, key it in here in DDD.MMSSss format (HP notation), then press R/S. if the deflection angle is not known, leave the value at zero and press $\mathrm{R} / \mathrm{S}$. The calculator then displays:

TANGENT LENGTH
then stops while displaying:
T?
0.0000

If the length of the tangent is known, key it in here and press $\mathrm{R} / \mathrm{S}$. If it is not known, leave the value at zero and press $\mathrm{R} / \mathrm{S}$. The calculator then displays:

## ARC LENGTH

then stops while displaying:
A?
0.0000

If the arc length is known, key it in here and press R/S. If it is not known, leave the alue at zero and press R/S.

If you have entered fewer than two parameter values, i.e., there are fewer than two non-zero values, the calculator briefly displays:

NOT ENOUGH then, briefly:
DATA! RE-ENTER

## Solve the Parameters of a Circular Horizontal Curve

and returns to prompting for the chord length, as above. You then are prompted for all the other possible data values, in turn, as shown above.

If you have entered more than two parameter values, the calculator briefly displays:
ONLY 2 INPUTS then, briefly:
SET 1 to 0!
and returns to prompting for the chord length, as above. You then are prompted for all the other possible data values, in turn, as shown above.

If you have entered exactly two parameter values, the calculator displays:
RUNNING then, briefly:
SOLUTION then, briefly:
CHORD
then stops and shows the chord value, e.g.:
$\mathrm{C}=$
258.8190

Press R/S. The calculator briefly displays:

## RADIUS

then stops and shows the radius value, e.g.:
$\mathrm{R}=$
500.0000

Press R/S. The calculator briefly displays:
TANGENT
then stops and shows the tangent length, e.g.:
$\mathrm{T}=$
133.9750

Press R/S/. The calculator briefly displays:
ARC LENGTH
then stops and shows the arc length, e.g.:
$\mathrm{A}=$
261.7990

## Solve the Parameters of a Circular Horizontal Curve

Press R/S. The calculator briefly displays:

## DEFLECTION $\theta$

then stops and shows the deflection angle, q , in HP notation (DDD.MMSSss format), e.g.:

$$
\mathrm{Q}=\quad 30.595900
$$

Press R/S. The calculator briefly displays:

## SEGMENT AREA

then stops and shows the area of the segment between the chord and the arc, e.g.:

$$
B=\quad 34,199.8470
$$

Press R/S. The program resets flag 10 to its original value, then stops and returns to normal calculator operation.

In the event that the parameters entered were the chord and arc lengths, or the tangent and arc lengths, the solution will take a little longer, and the calculator will display:

## SOLVING

for a short time, while the HP Solve process is being done. As this is the first step in both cases, it is followed by the calculator displaying:

RUNNING
before moving to display the solution.

## Sample Computations

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :--- | ---: | ---: | ---: |
| Radius | 500.000 | 500.000 | 500.000 |
| Deflection Angle | 30.000 | 45.000 | 60.000 |
| Chord Length | 258.819 | 382.683 | 500.000 |
| Tangent Length | 133.975 | 207.107 | 288.675 |
| Arc Length | 261.799 | 392.699 | 523.599 |
| Segment Area | $2,949.847$ | $9,786.423$ | $22,646.518$ |

Entering various combinations of any two values for any one solution should give the other parameter values. However, there may be some sensitivity when various input parameters are used, so that there will be some small variation in the output parameters in some cases, In
particular, the area may change by small amounts, and solutions that start with the arc length are sometimes particularly sensitive.

|  | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :--- | ---: | ---: | ---: |
| Radius | 500.000 | 500.000 | 500.000 |

| Chord Length | 707.107 | 866.025 | 965.926 |
| Tangent Length | 500.000 | 866.025 | $1,866.025$ |
| Arc Length | 785.398 | $1,047.198$ | $1,308.997$ |
| Segment Area | $71,349.541$ | $153,546.212$ | $264,749.235$ |

|  | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ |
| :--- | ---: | ---: | ---: |
| Radius | 500.000 | 500.000 | 250.000 |
| Deflection Angle | 170.000 | 105.000 | 109.4522 |
| Chord Length | 996.195 | 793.353 | 408.965 |
| Tangent Length | $5,715.026$ | 651.613 | 355.425 |
| Arc Length | $1,483.530$ | 916.298 | 478.901 |
| Segment Area | $349,176.444$ | $108,333.736$ | $30,452.048$ |

## Storage Registers Used

A Arc length (a).
B $\quad$ Segment area (A).
C Chord length (c).
Q Deflection angle ( $\theta$ ).
R Radius (r).
T Tangent length ( t ).
U Selector for TA or CA solutions in HP Solve.
Statistical Registers: Used to count the number of parameters entered, only the count ( n ) is used.

## Labels Used

Label $\mathbf{S} \quad$ Length $=1180 \quad$ Checksum $=$ F62D
Use the length ( $\mathrm{LN}=$ ) and Checksum $(\mathrm{CK}=$ ) values to check if program was entered correctly. Use the sample computation to check proper operation after entry.

## Routines Called

The program labeled $U$ looks at the value in the storage register $U$, and uses this to decide whether a TA (tangent and arc lengths) or CA (chord and arc length) solution is needed, then jumps to the part of the code that implements the equation to be solved. The HP Solve package in the calculator uses the code under label U as the basis for solving for the deflection angle $(\theta$, stored in Q the program), when called from the main program (under label S ). The subprogram under label U accesses the storage locations $\mathrm{A}, \mathrm{Q}$, and C or T , as needed, for the solution.

Label U Length $=93 \quad$ Checksum $=894 \mathrm{~F}$

## Flags Used

Flags 1 and 10 are used by this program. Flag 10 is set for this program, so that equations can be shown as prompts. Flag 1 is used to record the setting of Flag 10 before the program begins. At the end of the program, Flag 10 is reset to its original value, based on the value in Flag 1.

## Special Thanks

The original version of the program had an error in the formula for the area of the segment, which was also in the code, and hence in the examples. There were some other typos in the examples, as well. Asa Ramsay was kind enough to bring these to my attention, allowing me to fix them quickly and post a revised program.
